

Important: Ensure the valve is centered between the beads as shown below before inflating.

For any questions or additional assistance, please contact customer support at 877-743-3187 or ride1up.com/support

STEP-BY-STEP INSTRUCTIONS

1. Start inflating with a bike tire pump to the recommended PSI shown on the tire sidewalls

2. Monitoring the rim line, make sure the tire bead is properly set in place.

3. Deflate the tire slightly. Remove the valve core (valve key is supplied with Doc Blue puncture protection) and fill the tire with 60 ml of the puncture protection liquid.

4. Inflate the tire back to the recommended tire pressure. Evenly spread the puncture protection liquid within the tire by riding or rotating the wheel.

PLEASE NOTE:

- Strictly observe the recommendations regarding maximum tire inflation pressure.
- Do not use CO2 cartridges to inflate the tire, which can compromise existing punctures
- Be mindful when using the sealing liquid. It can easily stain clothing, carpeting, or furniture.
